AROMATIC AMINO ETHERS AS PAIN RELIEVING AGENTS

This invention relates to novel, aromatic compounds and pharmaceutically-acceptable salts thereof which possess useful pharmacological properties. More particularly the compounds of the invention are antagonists of the pain enhancing effects of E-type prostaglandins. The invention also relates to processes for the manufacture of the aromatic compounds and pharmaceutically-acceptable salts thereof; to novel pharmaceutical compositions containing them; and to use of the compounds in pain relief.

The compounds of the invention are useful in the treatment of pain such as the pain associated with joint conditions (such as rheumatoid arthritis and osteoarthritis), postoperative pain, post-partum pain, the pain associated with dental conditions (such as dental caries and gingivitis), the pain associated with burns (including sunburn), the treatment of bone disorders (such as osteoporosis, hypercalcaemia of malignancy and Paget's disease), the pain associated with sports injuries and sprains and all other painful conditions in which E-type prostaglandins wholly or in part play a pathophysiological role.

Non-steroidal anti-inflammatory drugs (NSAIDS) and opiates are the main classes of drugs in pain relief. However both possess undesirable side effects. NSAIDS are known to cause gastrointestinal irritation and opiates are known to be addictive.

We have now found a class of compounds structurally different to NSAIDS and opiates, and useful in the relief of pain.

The compounds of the invention may also possess anti-inflammatory, anti-pyretic and anti-diarrhoeal properties and be effective in other conditions in which prostaglandin E₂ (PGE₂) wholly or in part plays a pathophysiological role.

According to the invention there is provided a compound of the formula I;

It is to be understood that, insofar as certain of the compounds of formula (I) defined above may exist in optically active or racemic forms, by virtue of the compounds of the formula (I) containing an asymmetric carbon atom, the invention includes in its definition of active ingredient any such optically active or racemic form which possesses pain relieving properties. The synthesis of optically active forms may be carried out by standard techniques of organic chemistry well known in the art, for example by synthesis from optically active starting materials or by resolution of a racemic form. Similarly, pain relieving properties may be evaluated using the standard laboratory techniques referred to hereinafter.

An in vivo hydrolysable ester of a compound of the formula (I) containing carboxy group is, for example, a pharmaceutically acceptable ester which is hydrolysed in the human or animal body to produce the parent acid, for example, a pharmaceutically acceptable ester formed with a (1-6C)alcohol such as methanol, ethanol, ethylene glycol, propranol or butanol, or with a phenol or benzyl alcohol such as phenol or benzyl alcohol or a substituted phenol or benzyl alcohol wherein the substituent is, for example, a halo (such as fluoro or chloro), (1-4C)alkyl (such as methyl) or (1-4C)alkoxy (such as methoxy) group.

A suitable value for an in vivo hydrolysable amide of a compound of the formula I containing a carboxy group is, for example, a N-(1-6C)alkyl or N,N-di-(1-6C)alkyl amide such as N-methyl, N-ethyl, N-propyl, N,N-dimethyl, N-ethyl-N-methyl or N,N-diethyl amide.

A suitable pharmaceutically-acceptable salt of a compound of the formula (I) is, for example, an acid-addition salt of a compound of the formula (I) which is sufficiently basic, for example an acid-addition salt with an inorganic or organic acid such as hydrochloric, hydrobromic, sulphuric, trifluoroacetic, citric or maleic acid; or, for example a salt of a compound of the formula (I) which is sufficiently acidic, for example an alkali or alkaline earth metal salt such as a sodium, calcium or magnesium salt, or an ammonium salt, or a salt with an organic base such as methylamine, dimethylamine, trimethylamine, 2-hydroxyethylamine, piperidine,

- 19 -

morpholine or tris-(2-hydroxyethyl)amine or with an amino acid such as lysine or arginine.

In a further aspect the invention provides a process for preparing compounds of the formula (I) or pharmaceutically acceptable salts or in vivo hydrolysable amides or ester thereof, which comprises deprotecting a compound of the formula (VI):

wherein R^7 is R^1 or protected R^1 , R^8 is R^2 or protected R^2 , and, R^3 , R^4 , A, B, and D are as hereinabove defined, and any optional substituents are optionally protected and at least one protecting group is present;

and thereafter if necessary:

- i) forming a pharmaceutically acceptable salt;
- ii) forming an in vivo hydrolysable ester or amide;
- iii) converting one optional substituent into another optional substituent.

Protecting groups may in general be chosen from any of the groups described in the literature or known to the skilled chemist as appropriate for the protection of the group in question, and may be introduced by conventional methods.

Protecting groups may be removed by any convenient method as described in the literature or known to the skilled chemist as appropriate for the removal of the protecting group in question, such methods being chosen so as to effect removal of the protecting group with minimum disturbance of groups elsewhere in the molecule.

A suitable protecting group for a hydroxy group is, for example, an arylmethyl group (especially benzyl), a tri-(1-4C)alkylsilyl group (especially trimethylsilyl or tert-butyldimethylsilyl), an aryldi-(1-4C)alkylsilyl group (especially dimethylphenylsilyl), a diaryl-(1-4C)alkylsilyl group (especially tert-butyldiphenylsilyl), a (1-4C)alkyl group (especially methyl), a (2-4C)alkenyl group (especially allyl), a (1-4C)alkoxymethyl group

- 20 -

(especially methoxymethyl) or a tetrahydropyranyl group (especially tetrahydro-2H-pyran-2-yl). The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an arylmethyl group such as a benzyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-charcoal. Alternatively a trialkylsilyl or an aryldialkylsilyl group such as a tert-butyldimethylsilyl or a dimethylphenylsilyl group may be removed, for example, by treatment with a suitable acid such as hydrochloric, sulphuric, phosphoric or trifluoroacetic acid, or with an alkali metal or ammonium fluoride such as sodium fluoride or, preferably, tetrabutylammonium fluoride. Alternatively an alkyl group may be removed, for example, by treatment with an alkali metal (1-4C)alkylsulphide such as sodium thioethoxide or, for example, by treatment with an alkali metal diarylphosphide such as lithium diphenylphosphide or, for example, by treatment with a boron or aluminium trihalide such as boron tribromide. Alternatively a (1-4C)alkoxymethyl group or tetrahydropyranyl group may be removed, for example, by treatment with a suitable acid such as hydrochloric or trifluoroacetic acid.

Alternatively a suitable protecting group for a hydroxy group is, for example, an acyl group, for example a (2-4C)alkanoyl group (especially acetyl) or an aroyl group (especially benzoyl). The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide.

A suitable protecting group for an amino, imino or alkylamino group is, for example, an acyl group, for example a (2-4C)alkanoyl group (especially acetyl), a (1-4C)alkoxycarbonyl group (especially methoxycarbonyl, ethoxycarbonyl or tert-butoxycarbonyl), an arylmethoxycarbonyl group (especially benzyloxycarbonyl) or an aroyl group (especially benzoyl). The deprotection conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl, alkoxycarbonyl or aroyl group may be removed for example, by

- 21 -

hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such as a tert-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid such as hydrochloric, sulphuric or phosphoric acid or trifluoroacetic acid, and an arylmethoxycarbonyl group such as a benzyloxycarbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-charcoal.

A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a (1-4C)alkyl group (especially methyl or ethyl) which may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide; or, for example, a tert-butyl group which may be removed, for example, by treatment with a suitable acid such as hydrochloric, sulphuric or phosphoric acid or trifluoroacetic acid.

wherein A, D, R³ and R⁴ are as hereinabove defined.

The reaction between compounds of the formulae (VIII) and (XIX) may be carried out under standard conditions known in the art for the formation of an imine (Schiffs base), which can be reduced in situ. For example imine formation and reduction in situ may be carried out in an inert solvent such toluene or tetrahydrofuran, in the presence of a reducing agent such as sodium cyanoborohydride (NaCNBH₃) under acidic conditions (Synthesis 135, 1975; Org. Prep. Proceed. Int. 11, 201, 1979).

Compounds of the formulae (IX) and (X) may be reacted together under standard conditions for example, in an aprotic solvent such as DMF in the presence of a weak base, in a temperature range of ambient to 180°C. Suitable bases include sodium hydrogencarbonate and amide bases such as Hunig's base, N-ethyl-N,N-diisopropylamine, tributylamine or 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU). Suitable values for X include, halo, tosylate, mesylate and triflate. In particular X is chloro or bromo. Preferably R⁷ is an amide or acid.

The compounds of the formulae (VIII) and (XI) may be reacted together under in an aprotic solvent such as DMF, in the presence of a base such as potassium carbonate or sodium hydride and in a temperature range of 0°C to 100°C. Suitable values for X¹ include halo, tosylate, mesylate and triflate. In particular X¹ is bromo.

Particular values for R¹⁰ include cyano, carbamoyl, alkoxycarbonyl, carboxy and activated carboxy groups such as acid chlorides and activated esters.

The cyano group may be converted into a tetrazole ring by reacting, for example, with ammonium or tin azide in an aprotic solvent such as DMF, in a temperature range of 100°C to 130°C. For further information on tetrazole synthesis see S.J. Wittenberger and B.J. Donner JOC, 1993, 58, 4139-4141; BE Huff et al, Tet. Lett, 1993, 50, 8011-8014; and J.V. Duncia et al, JOC 1991, 56, 2395-2400.

Alkoxycarbonyl may be converted into a carboxy group by acid or base hydrolysis. For example, base hydrolysis may be carried out in an organic solvent such as methanol or THF in a temperature range of ambient to 100°C, in the presence of sodium hydroxide or

- 25 -

potassium hydroxide.

Acid hydrolysis may, for example, be carried out or in neat formic acid or neat trifluoroacetic acid optionally in an organic solvent such as dichloromethane.

An alkoxycarbonyl or an activated carboxy group, such as an acid chloride or activated ester, or an acyl group such as an alkanoyl group may be converted to an amide group by reacting with the appropriate amine in an inert solvent such as DMF or dichloromethane, in a temperature range of 0°C to 150°C, preferably around ambient temperature, in the presence of a base such as triethylamine.

The compounds of the formulae (XIV) and R^8X^2 may be reacted together in an aprotic solvent such as DMF in the presence of a base such as sodium carbonate or sodium hydride. Suitable values for X^2 are halo, tosylate, mesylate and triflate, in particular halo such as iodo.

The reaction between compounds of the formulae (XV) and (XVI) is conveniently carried out under mild conditions known for the Mitsunobu reaction, for example in the presence of di (C_{1-4} alkyl)-azocarboxylate and triphenylphosphine or 1¹,1¹-(azodicarbonyl)-dipiperidine and tributylphosphine (Tet. Lett. 34, 1993, 1639-1642) in an inert solvent such as toluene, benzene, tetrahydrofuran or diethylether, in particular toluene. Examples of the removable activating groups are tert-butyloxycarbonyl and trifluoroacetyl.

Compounds of the formulae (XVII) and (XVIII) are generally reacted together in the presence of a strong base such as sodium hydride, lithium diisopropylamide or $LiN(SiMe_3)_2$, in DMF or an etherial solvent such as ethyl ether or THF, in a temperature range of -78°C to ambient temperature. Suitable values for R^{12} are halogen, for example chloro or bromo, or sulphonates, for example, methanesulphonate or tosylate. Examples of activating groups for R^{13} include tert-butyloxycarbonyl and trifluoroacetyl.

The compounds of the formulae (IX), (XI), (XIII), (XV), (XVII) and (XIX) are conveniently prepared by reacting a compound of

- 26 -

the formula (XX) with a compound of the formula (XXI):

(XX)

(XXI)

wherein A, D and R^4 are as hereinabove defined, Z' is $-\text{C}(\text{O})\text{R}^3$ or a precursor group (such as an ester or nitrile) $-\text{CH}(\text{R}^3)(\text{NHR}^8)$, $-\text{CH}(\text{R}^3)(\text{X}^1)$ or precursor group (such as hydroxyalkyl) or $-\text{CH}(\text{R}^3)\text{OH}$, as appropriate, and X^3 is a leaving group and any functional groups are optionally protected and any precursor groups subsequently converted as necessary.

Suitable leaving groups include tosylate, mesylate, triflate and halo, for example chloro or bromo. The reaction between compounds of the formulae (XX) and (XXI) may be performed in an inert organic solvent such as acetone or DMF, in a temperature range of ambient temperature to 60°C , in the presence of a mild base. For example, when X^3 is bromo, reacting (XX) and (XXI) together in DMF, at ambient temperature in the presence of a base such as potassium carbonate. Alternatively a phase transfer system could be used. When X^3 is hydroxy, the Mitsunobu reaction could be used (O. Synthesis, 1981, 1.).

The compounds of the formula (XIII) may be prepared using processes a), b), c), e), f) or g) from the appropriate starting material wherein R^7 is replaced with R^{10} .

The compounds of the formula (XIV) may be prepared by using any one of processes a), b) c), d), f) or g) from the appropriate starting materials wherein R^8 is hydrogen.

The compounds of the formulae (XVI) and (XVIII) can readily be prepared from compounds of the formula (VIII).

The compounds of the formulae (VIII), (X), (XX) and (XXI) are generally known in the art or can be made by methods analogous to or similar to those used in the Examples or those known in the art for related compounds. Certain compounds of the formula (X), wherein X is

- 27 -

chloro or bromo, can be prepared by converting an oxo group in the ring system into chloro or bromo by reacting the oxo ring system with a chlorinating agent, such as sulphonyl chloride, phosphorous trichloride, phosphorous pentachloride or POCl_3 , or brominating agent such as phosphorous tribromide or $\text{P}(\text{O})\text{Br}_3$, in an inert aprotic solvent.

It is also possible to synthesise certain intermediates and even protected compounds using primarily ring synthesis. Here, reference is made to the compendiums 'The Chemistry of Heterocyclic Compounds' E.C. Taylor and A. Weissberger (published by John Wiley and Sons) and 'Comprehensive Heterocyclic Chemistry', A.R. Katritzky and C. W. Rees (published by Pergamon Press (Elsevier)).

Optional substituents may be converted into other optional substituents. For example an alkylthio group may be oxidised to an alkylsulphinyl or alkylsulphonyl group, a nitro group reduced to an amino group, a hydroxy group alkylated to a methoxy group, or a bromo group converted to an alkylthio group.

Various substituents may be introduced into compounds of the formulae (I) and (III) and intermediates in the preparation of compounds of the formulae (I) and (III), when appropriate, using standard methods known in the art. For example, an acyl group or alkyl group may be introduced into an activated benzene ring using Friedel-Crafts reactions, a formyl group by formylation with titanium tetrachloride and dichloromethyl ethyl ether, a nitro group by nitration with concentrated nitric acid concentrated sulphuric acid and bromination with bromine or tetra(n-butyl)ammonium tribromide.

It will be appreciated that, in certain steps in the reaction sequence to compounds of the formula (I), it will be necessary to protect certain functional groups in intermediates in order to prevent side reactions. Deprotection may be carried out at a convenient stage in the reaction sequence once protection is no longer required.

As stated hereinbefore compounds of the formula (I) are antagonists of the pain enhancing effects of E-type prostaglandins and of value in the relief of mild to moderate pain which, for example, accompanies inflammatory conditions such as rheumatoid arthritis and

- 28 -

osteoarthritis. Certain properties of the compounds may be demonstrated using the test procedures set out below:-

(a) an in-vitro guinea pig ileum assay which assesses the inhibitory properties of a test compound against PGE_2 -induced contractions of the ileum; ileum was immersed in oxygenated Krebs solution containing indomethacin (4 $\mu\text{g/ml}$) and atropine (1 μM) and which was maintained at 37°C ; the ileum was subject to a tension of 1 g; a control dose response curve for PGE_2 -induced contraction of the ileum was obtained; test compound (dissolved in dimethylsulphoxide) was added to the Krebs solution and a dose response curve for the PGE_2 -induced contraction of the ileum in the presence of the test compound was obtained; the pA_2 value for the test compound was calculated;

(b) an in-vivo assay in mice which assesses the inhibitory properties of a test compound against abdominal constriction response induced by the intraperitoneal administration of a noxious agent such as dilute acetic acid or phenylbenzoquinone (hereinafter PBQ) using the procedure disclosed in European Patent Application No. 0218077.

Although the pharmacological properties of the compounds of the formula I vary with structural change as expected, in general activity possessed by compounds of the formula I may be demonstrated at the following concentrations or doses in one or more of the above-mentioned Tests (a) and (b):-

Test (a):- $\text{pA}_2 > 5.3$;

Test (b):- ED_{30} in the range, for example, 0.01-100 mg/kg orally.

No overt toxicity or other untoward effects were noted in Test (b) when compounds of the formula I are administered at several multiples of their minimum inhibitory dose.

Prostaglandin receptors and in particular receptors for PGE_2 have been tentatively characterised by Kennedy et al. (Advances in Prostaglandin, Thromboxane and Leukotriene Research, 1983, 11, 327). The known PGE_2 antagonist SC-19220 blocks the effect of PGE_2 on some tissues such as guinea pig ileum or dog fundus but not on other tissues such as the cat trachea or chick ileum. Those tissues which did possess SC-19220 sensitive mediated effects were said to possess

- 29 -

EP₁ receptors. Based on this compounds of the present invention, possessing activity in Test (a), are EP₁ antagonists.

According to a further feature of the invention there is provided a pharmaceutical composition which comprises a compound of the formula (I) or an in-vivo hydrolysable ester thereof or an amide thereof, or a pharmaceutically-acceptable salt thereof, in association with a pharmaceutically-acceptable diluent or carrier.

The composition may be in a form suitable for oral use, for example a tablet, capsule, aqueous or oily solution, suspension or emulsion; for topical use, for example a cream, ointment, gel, spray or aqueous or oily solution or suspension; for nasal use, for example a snuff, nasal spray or nasal drops; for vaginal or rectal use, for example a suppository or rectal spray; for administration by inhalation, for example as a finely divided powder or a liquid aerosol; for sub-lingual or buccal use, for example a tablet or capsule; or for parenteral use (including intravenous, subcutaneous, intramuscular intravascular or infusion), for example a sterile aqueous or oily solution or suspension. In general the above compositions may be prepared in a conventional manner using conventional excipients.

The amount of active ingredient (that is a compound of the formula (I) or a pharmaceutically-acceptable salt thereof) that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 0.5 mg to 2 g of active agent compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition.

According to a further feature of the invention there is provided a compound of the formula (1) or an in-vivo hydrolysable ester or amide or a pharmaceutically-acceptable salt thereof, for use in a method of treatment of the animal (including human) body by therapy.

According to a further feature of the invention there is provided the use of a compound of the formula I, or an in-vivo

- 30 -

hydrolysable ester or amide or a pharmaceutically-acceptable salt thereof, in the manufacture of a medicament for use in the relief of pain in the animal (including human) body.

According to a further feature of the invention there is provided a method for the relief of pain in the animal (including human) body in need of such treatment which comprises administering to said body an effective amount of a compound of the formula I, or an in-vivo hydrolysable ester or amide or a pharmaceutically-acceptable salt thereof.

As mentioned above, a compound of the formula (I) is useful in treating the pain which, for example, accompanies inflammatory conditions such as rheumatoid arthritis and osteoarthritis. In using a compound of the formula I for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.1 mg to 75 mg per kg body weight is received, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous administration, a dose in the range, for example, 0.05 mg to 30 mg per kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 0.05 mg to 25 mg per kg body weight will be used.

Although the compounds of the formula (I) are primarily of value as therapeutic agents for use in warm-blooded animals (including man), they are also useful whenever it is required to antagonise the effects of PGE_2 at the EP_1 receptor, based on test a). Thus, they are useful as pharmacological standards for use in the development of new biological tests and in the search for new pharmacological agents.

By virtue of their ability to relieve pain, the compounds of the formula I are of value in the treatment of certain inflammatory and non-inflammatory conditions which are currently treated with a cyclooxygenase-inhibitory non-steroidal anti-inflammatory drug (NSAID) such as indomethacin, ketorolac, acetylsalicylic acid, ibuprofen, sulindac, tolmetin and piroxicam or other analgesics such as paracetamol, tramadol, Codein or in some circumstances morphine. Co-administration of a compound of the formula I with a NSAID can result in a reduction of the quantity of the latter agent needed to

- 31 -

produce a therapeutic effect. Thereby the likelihood of adverse side-effects from the NSAID such as gastrointestinal effects are reduced. Thus according to a further feature of the invention there is provided a pharmaceutical composition which comprises a compound of the formula (I), or an in-vivo hydrolysable ester or amide or pharmaceutically-acceptable salt thereof, in conjunction or admixture with a cyclooxygenase inhibitory non-steroidal anti-inflammatory agent, and a pharmaceutically-acceptable diluent or carrier.

The compounds of the invention may also be used with other anti-inflammatory agents such as an inhibitor of the enzyme 5-lipoxygenase (such as those disclosed in European Patent Applications Nos. 0351194, 0375368, 0375404, 0375452, 037547, 0381375, 0385662, 0385663, 0385679, 0385680).

The compounds of the formula (I) may also be used in the treatment of conditions such as rheumatoid arthritis in combination with antiarthritic agents such as gold, methotrexate, steroids and penicillinamine, and in conditions such as osteoarthritis in combination with steroids.

The compounds of the present invention may also be administered in degradative diseases, for example osteoarthritis, with chondroprotective, anti-degradative and/or reparative agents such as Diacerhein, hyaluronic acid formulations such as Hyalan, Rumalon, Arteparon and glucosamine salts such as Antril.

The compositions of the invention may in addition contain one or more other therapeutic or prophylactic agents known to be of value for the treatment of pain. Thus for example, a known opiate pain-killer (such as dextropropoxyphene, dehydrocodeine or codeine) or an antagonist of other pain or inflammation mediators, such as bradykinin, neurokinin and calcitonin gene related peptides (CGRP), or an α_2 -adrenoceptor agonist, a GABA_B receptor agonist, a calcium channel blocker, a sodium channel blocker, a CCK_B receptor antagonist, or an antagonist or modulator of the action of glutamate at the NMDA receptor may usefully also be present in a pharmaceutical composition of the invention.

The compounds of the present invention may also be administered in bone diseases such as osteoporosis alone or in

- 32 -

combination with calcitonin and bisphosphonates and estrogens.

The invention will now be illustrated in the following non-limiting Examples in which, unless otherwise stated:-

(i) evaporations were carried out by rotary evaporations in vacuo and work-up procedures were carried out after removal of residual solids by filtration;

(ii) yields are given for illustration only and are not necessarily the maximum attainable;

(iii) the end-products of the formula I have satisfactory microanalysis and their structures were generally confirmed by NMR and mass spectral techniques;

(iv) intermediates were not generally fully characterised and purity was assessed by thin layer chromatographic, infra-red (IR) or NMR analysis;

(v) melting points are uncorrected and were determined using a Mettler SP62 automatic melting point apparatus or an oil-bath apparatus; melting points for the end-products of the formula I were determined after recrystallisation from a conventional organic solvent such as ethanol, methanol, acetone, ether or hexane, alone or in admixture;

(vi) the following abbreviations have been used:-

DMF N,N-dimethylformamide;

THF tetrahydrofuran;

DMSO dimethylsulphoxide;

DIBAL diisobutylaluminium hydride;

DEAD diethylazodicarboxylate.

The final product was purified by crystallisation from CH_2Cl_2 /hexane. The starting ester was prepared using a similar method to that of Reference Example 23 except iodomethane was used in place of iodoethane in the alkylation step.

h) The product was extracted with dichloromethane and purified by crystallising from dichloromethane/hexane followed by flash chromatography eluting with 10% methanol in dichloromethane.

i) Ethanol was used as the solvent in the hydrolysis and the product was purified by flash chromatography eluting with methanol: dichloromethane mixtures (0:100, 1:99, 5:95, 10:90).

$^1\text{H NMR}$ ($\text{DMSO}-d_6 + \text{AcOH}-d_4$ heated to 323K): δ 4.61 (q, 2H, $J=8.2\text{Hz}$), 4.93 (s, 2H), 5.15 (s, 2H), 7.08 (d, 1H, $J=8.5\text{Hz}$), 7.15-7.23 (m, 3H), 7.32-7.48 (m, 6H), 7.89 (d, 1H, $J=8.5\text{Hz}$).

The starting material was prepared as follows:

A mixture of 2,2,2-trifluoroethylamine hydrochloride (68 g), diethyl ether (500 ml) and 40% aqueous sodium hydroxide solution (55 ml) was shaken together. The organic layer was dried (MgSO_4), added to 2-benzyloxy-5-bromobenzylbromide (17.0 g) in dichloromethane (100 ml) and left to stand in a closed flask for 72 hours. The solvent was evaporated, the residue partitioned between diethyl ether and 2N aqueous sodium hydroxide. The organic layer was removed, dried (MgSO_4) and evaporated to give N-(2,2,2-trifluoroethyl)-2-benzyloxy-5-bromobenzylamine (17.5 g) as a yellow oil.

N-(2,2,2-Trifluoroethyl) 2-benzyloxy-5-bromobenzylamine (9.2 g), butyl 6-chloropyridazine-3-carboxylate (5.4 g) and tosic acid (100 mg) were

- 86 -

heated together at 120°C for 18 hours. The resulting residue was purified by chromatography, eluting with dichloromethane, then 10% diethyl ether/dichloromethane, to give four products. The third product was further purified by re-chromatography, eluting with 5% diethyl ether/dichloromethane to give butyl 6-[N-(2-benzyloxy-5-bromobenzyl)-N-(2,2,2-trifluoroethyl)amine]pyridazine-3-carboxylate.

b) Preparation of starting material:

4-Cyano-3-hydroxy-1,2,5-thiadiazole [CA 111 134167, East German Patent No. DD 263,767] was converted to 4-benzyloxy-1,2,5-thiadiazole-3-nitrile using a similar method to that of Reference example 12. The nitrile was converted to 4-benzyloxy-1,2,5-thiadiazole-3-carboxylic acid using a similar method to that of example 1, except it was heated for 24 hours and the product was isolated by extraction with ethyl acetate.

The carboxylic acid was converted to the corresponding acid chloride and reacted with methyl 4-aminobenzoate using a similar method to that described in example 4 to give methyl 4-(4-benzyloxy-1,2,5-thiadiazol-3-ylcarbamoyl)benzoate.

- 90 -

The above methyl ester was reduced to give methyl 4-[4-benzyloxy-1,2,5-thiadiazol-3-ylmethylamino]benzoate using a similar process to that of reference example 10. This methyl ester was alkylated using a similar method to that of reference example 5 to give methyl 4-[N-(4-benzyloxy-1,2,5-thiadiazol-3-ylmethyl)-N-ethylamino]benzoate.

e) Preparation of ethyl 2-amino-1-methyl-1H-imidazole-5-carboxylate:

Sarcosine ethyl ester hydrochloride (76 g) was added to a solution of sodium formate (37 g) dissolved in formic acid (163 ml) and the mixture was stirred at ambient temperature for 4 hours and filtered. Acetic anhydride (222 ml) was added dropwise to the filtrate (exotherm to 60°C) and the mixture was allowed to stand at ambient temperature for 10 hours. The solvent was evaporated and the residue was triturated with acetone and the NaCl was filtered. The solvent was evaporated and the residue was distilled under high vacuum to give ethyl N-formyl sarcosine ester 50.6 g, bp 80-82°C at 0.05-0.05 mmHg.

Potassium-t-butoxide (52.3 g) was suspended in diethylether (500ml) and cooled to 0°C. A solution of N-formyl sarcosine ether ester (67.66 g) and methyl formate (27.9 g) in diethylether (200 ml) was added dropwise over 30 minutes and the mixture was stirred at 0°C for 1 hour. The solid product was filtered (76.6 g) and used immediately for the next stage. The ethyl-2-(N-formyl-N-methyl)-3-oxopropionate prepared as described above was dissolved in water and concentrated HCl (138 ml) was added. The mixture was heated on a steam bath for 30 minutes, cooled and the pH was adjusted to 5 by addition of concentrated NaOH. Cyanamide (19.3 g) was added and the mixture was heated at 100°C for 1 hour. The mixture was allowed to cool and was basified with concentrated aqueous ammonium hydroxide, the solid was filtered, washed with water and dried under reduced pressure and was crystallised from EtOAc (300 ml) to give ethyl 2-amino-1-methyl-1H-imidazole-5-carboxylate yield 14.6 g.

Methyl 2-amino-1-methyl-1H-imidazol-5-carboxylate and the corresponding ethyl ester may be prepared using the method described in J. Med. Chem 1972, 15, 1086.

Footnotes**a** Preparation of ethyl 5-(t-butoxycarbonylamino)thiophene-carboxylate:

Ethyl thiophene-2-carboxylate (50 g) in THF (500 ml) was added dropwise to a solution of lithium diisopropylamide prepared at -78°C from diisopropylamine (32 g) and n-BuLi (200 ml of a 1.6M solution in hexanes) at such a rate that the internal temperature did not exceed -60°C. The mixture was stirred at -78°C for 30 minutes. Freshly crushed solid carbon dioxide (50 g) was added and the mixture was allowed to warm to ambient temperature. The solvent was evaporated and the residue was dissolved in water (500 ml) and acidified with 2N HCl, the solid product was filtered and dried under reduced pressure to give monoethyl ester of thiophene 2,5-dicarboxylic acid, yield 44 g.

Diphenylphosphoryl azide (62.3 g) was added to a mixture of the monoethyl ester of 2,5-thiophenedicarboxylic acid (45 g), triethylamine (21 g) and t-butanol (50 ml) in THF (200 ml) and the mixture was heated under reflux for 18 hours. The reaction mixture was allowed to cool and was evaporated to dryness. The residue was dissolved in EtOAc (500 ml) and was washed consecutively with aqueous 5% citric acid (3 x 10 ml) and aqueous sodium bicarbonate (3 x 100 ml) and was dried (MgSO₄). The residue obtained on removal of the solvent was subjected to chromatography on silica, eluting with dichloromethane to give ethyl 5-(t-butoxycarbonylamino)thiophenecarboxylate which was used in subsequent steps without further purification.
